HELENA FIBRINOGEN ASSAY KIT

Cat. No. 5376

Helena Fibrinogen Assay Kit

Contains:
- Helena Thrombin Reagent (5 x 2.0 mL)
- Helena Fibrinogen Calibrator (2 x 1.0 mL)
- Owren's Veronal Buffer (2 x 25 mL)
- Fibrinogen Graph Paper

Components sold separately:
- Helena Thrombin Reagent (10 x 2.0 mL) 5374
- Helena Thrombin Reagent (10 x 5.0 mL) 5378
- Helena Fibrinogen Calibrator (10 x 1.0 mL) 5379
- Owren's Veronal Buffer (10 x 25 mL) 5375

Additional Equipment & Supplies
- Norm-Trol Coagulation Control 5186
- Coagulation A.R.P.® (10 x 1 mL) 5185
- Cascade® 480 1430

For Sales, Technical and Order Information, and Service Assistance, call 800-231-5663 toll free.

HELENA FIBRINOGEN ASSAY KIT

The Helena Fibrinogen Assay Kit is intended for use in the quantitative determination of fibrinogen in human plasma.

SUMMARY

Fibrinogen, a high-molecular weight glycoprotein in plasma, plays a key role in hemostasis. Upon generation of thrombin, fibrinogen is converted to the insoluble polymer, fibrin. Sufficient fibrinogen must be present in the circulation to arrest bleeding and repair tissue should vascular trauma or injury occur. Thus, the determination of fibrinogen in plasma is important in an assessment of a thrombotic disorder.

Fibrinogen is an acute-phase reactant, increasing in the plasma as a result of inflammation, pregnancy and oral contraceptive use. Decreased levels are found in certain pathological states including liver disease and disseminated intravascular coagulation (DIC). Congenital deficiencies include afibrinogenemia (no detectable fibrinogen), hypofibrinogenemia (<1 mg/mL) and dysfibrinogenemia (abnormal fibrinogen).

PRINCIPLES

Clauss developed a simple method for the quantitative determination of fibrinogen by measuring the clotting time of dilute plasma following the addition of thrombin. At relatively high thrombin concentrations (>30 NIH units/mL) and low fibrinogen concentrations (2.0-30.0 mg/dL) the clotting time is dependent on the fibrinogen level. The thrombin clotting time, under these conditions, plotted on a log-log scale versus the fibrinogen concentration, is linear.

REAGENTS

1. Helena Thrombin Reagent

Ingredients: The reagent contains a lyophilized preparation of approximately 100 NIH units/mL of bovine thrombin with added stabilizers.

CAUTION: FOR IN-VITRO DIAGNOSTIC USE

Preparation for Use: Reconstitute a vial of Thrombin Reagent with 2.0 mL or 5.0 mL of distilled or deionized water. Refer to the vial label for the appropriate reconstitution volume. Invert gently to mix and allow to stand until dissolved.

Storage and Stability: The lyophilized product should be stored at 2-6°C. The reconstituted thrombin is stable for 8 hours at room temperature (15-30°C) or 1 week at 2-6°C.

Signs of Deterioration: Discard the vial if it shows signs of precipitation or microbial contamination.

2. Helena Fibrinogen Calibrator

Ingredients: The calibrator consists of a lyophilized citrated normal human plasma assayed for fibrinogen using a functional clotting assay.

Preparation for Use: Reconstitute each vial with 1.0 mL of distilled or deionized water, restopper vial and allow to stand until dissolved. Invert gently to mix. Do not shake.

CAUTION: FOR IN-VITRO DIAGNOSTIC USE

Preparation for Use: Reconstitute each vial with 1.0 mL of distilled or deionized water, restopper vial and allow to stand until dissolved. Invert gently to mix. Do not shake.

Storage and Stability: The lyophilized product should be stored at 2-6°C. The reconstituted thrombin is stable for 8 hours at room temperature (15-30°C) or 1 week at 2-6°C.

Signs of Deterioration: Discard the vial if it shows signs of precipitation or microbial contamination.

3. Owren's Veronal Buffer

Ingredients: The buffer contains 28.4 mM barbituric acid, 0.125 M sodium chloride and 0.05% sodium azide as a preservative.

CAUTION: FOR IN-VITRO DIAGNOSTIC USE - DO NOT INGEST.

Preparation for Use: The buffer is ready for use as packaged.

For Sales, Technical and Order Information, and Service Assistance, call 800-231-5663 toll free.

Helena Laboratories warrants its products to meet our published specifications and to be free from defects in materials and workmanship. Helena's liability under this contract or otherwise shall be limited to the purchase price attributable to the goods to which such claim is made. These alternatives shall be buyer's exclusive remedies.

In no case will Helena Laboratories be liable for consequential damages even if Helena has been advised of the possibility of such damages. The foregoing warranties are in lieu of all warranties expressed or implied including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose.
Storage and Stability: The buffer is stable until the date indicated on the label when stored at 2-6°C. Exercise care when pipetting to avoid contamination. 

Signs of Deterioration: Discard the buffer if visible signs of microbial contamination occur.

INSTRUMENT
Any high quality electro- mechanical or photopolar coagulation instrument may be used such as the Helena Cascade® 480 (Automated Coagulation Analyzer), Cat. No. 1430.

SPECIMEN COLLECTION AND HANDLING
Specimen: Plasma obtained from whole blood collected with sodium citrate as an anticoagulant is the specimen of choice. The concentration of the sodium citrate should be 3.8% (0.129 M) or 3.2% (0.109 M).

Specimen Preparation: Refer to the NCCLS guideline H-21-AZ on Specimen Collection and Preparation for Coagulation Studies. Whole blood should be collected into a plastic syringe, evacuated blood collection tubes, a 2-syringe technique, or with a butterfly and syringe technique. Accurate coagulation studies depend upon the correct whole blood to anticoagulant ratio. For blood specimens with hematocrits (HCT) of 40-50% (normal), 9 parts of freshly collected whole blood should be immediately added to one part anticoagulant. For blood specimens with hematocrits outside the normal range, adjust the amount of whole blood added to the anticoagulant according to the following formula: 
\[
\text{Parts whole blood to one part anticoagulant} = \frac{0.6}{1 - \text{HCT}}
\]
Particular care should be taken when using evacuated blood collection tubes as they are designed to draw 9 parts blood to 1 part anticoagulant. Therefore, if the hematocrit is abnormal, blood should be drawn into a syringe and an appropriate amount mixed with an adjusted volume of citrate anticoagulant. For greater stability of the specimen, an acid citrate anticoagulant solution should be prepared and utilized. The anticoagulant is prepared as follows:

3 parts 0.1 M sodium citrate
2 parts 0.1 M citric acid

Specimen Storage and Stability: The anticoagulated whole blood specimen should be centrifuged at 1600-2000 x G for 10 minutes followed by immediate removal of plasma. Prior to testing, the plasma sample should be stored at 2-6°C in capped plastic test tubes. Studies have shown that there is no significant change in fibrinogen levels on plasma samples stored up to 3 days at 2-6°C; nevertheless, it is good laboratory practice to test samples as soon as possible after collection. Plasma may be stored at -20°C, or colder, for at least one month. Thaw quickly at 37°C prior to testing.

PROCEDURE
Materials Provided:
1. Helena Fibrinogen Assay Kit
   Cat. No. 5376
   Contains:
   - Helena Thrombin Reagent (5 x 2.0 mL)
   - Helena Fibrinogen Calibrator (2 x 1.0 mL)
   - Owren’s Veronal Buffer (2 x 25 mL)
   - Fibrinogen Graph Paper

Additional Equipment and Supplies
- Norm-Trol Coagulation Control
  5186
- Coagulation A.R.P.® (10 x 1 mL)
  5185
- Cascade® 480
  1430

Materials Required but not Provided:
- Reaction cups
- Stopwatch
- Plastic test tubes, 12 x 75 mm
- 37°C heat block or water bath
- Centrifuge
- Pipetting Devices – 0.05 mL, 0.1 mL, 0.2 mL

STEP BY STEP METHOD
I. Calibration
   a. Incubate 0.2 mL of calibrator dilution (10 x 1 mL) at 37°C in capped plastic test tubes.
   b. Pipette 0.2 mL of diluted specimens into a specimen cup and incubate it for 4 minutes at 37°C. Do not exceed 5 minutes at 37°C.
   c. Add 0.1 mL of Thrombin Reagent (room temperature) to initiate the timed reaction.
   d. Determine the clotting time by averaging the readings of the duplicate determinations.

Quality Control
A control should be run with each standard curve or set of assays. Helena Norm-Trol and A.R.P.® have been assayed for fibrinogen and are highly recommended. When the control is used, the fibrinogen values must fall within the stated variation (usually ± 2 S.D.) given on the package insert or the data should be repeated or considered suspect.

Calculation of Unknown
Read the results of the patient and control dilutions from the standard curve by drawing a line from the test clotting time on the curve, down through the X-axis, to give the concentration of fibrinogen in mg/dL. The Cascade® 480 will automatically perform calculations and print results.

RESULTS
The fibrinogen assay on the test specimen is generally performed using a 1:10 dilution of plasma. The concentration can then be read in mg/dL directly from the standard curve. For plasma dilutions other than 1:10, the concentration from the curve should be multiplied by the dilution factor (i.e., multiply the concentration with the duplicate amount being assayed, or by 0.5 when assaying a 1:5 dilution). If no detectable clotting occurs using a 1:3 dilution of patient plasma, this is indicative of either a fibrinogen concentration of less than 20 mg/dL, or the presence of some interfering substance (see Limitations of Procedure).

EXPECTED VALUES
Plasma of healthy adults contains about 150 to 350 mg/dL of fibrinogen. Helena tested thirty-two (32) presumed healthy donors for fibrinogen levels and obtained the following data.

\[
\bar{X} = 275.0 \text{ mg/dL}
\]

Range (2SD) = 162.4 - 387.7 mg/dL

Each laboratory should establish its own normal range on a representative sample population since normal values vary from laboratory to laboratory.

LIMITATIONS
Significant levels of heparin or fibriolitic degradation may cause the test to indicate a falsely low fibrinogen level. However, because of the high thrombin concentrations used and the dilution of the plasma, heparin concentrations below 0.6 USP units/mL and levels of fibrinolytic degradation products below 100 µg/mL do not significantly affect fibrinogen values.

PERFORMANCE CHARACTERISTICS
Precision Studies
Within Run: Twenty normal and twenty abnormal control samples were tested and the following data was noted:

<table>
<thead>
<tr>
<th>Concentration (mg/dL)</th>
<th>Normal</th>
<th>Abnormal</th>
</tr>
</thead>
<tbody>
<tr>
<td>302.9</td>
<td>101.4</td>
<td></td>

Plasma may be stored at -20°C, or colder, for at least one month. Thaw quickly at 37°C prior to testing.

PROCEDE

**Materials Provided:**

- Helena Fibrinogen Assay Kit 5376
  - Contains: Helena Thrombin Reagent (5 x 2.0 mL)
  - Helena Fibrinogen Calibrator (2 x 1.0 mL)
  - Owren’s Veronal Buffer (2 x 25 mL)
  - Fibrinogen Graph Paper

**ADDITIONAL EQUIPMENT AND SUPPLIES**

- Norm-Trol Coagulation Control 5186
- A.R.P.® (10 x 1 mL) 5185
- Cascade® (100 x 0.5 mL) 1430

**MATERIALS REQUIRED BUT NOT PROVIDED:***

- Reaction cups
- Stopwatch
- Plastic test tubes, 12 x 75 mm
- 37°C heat block or water bath
- Centrifuge
- Pipetting Devices – 0.05 mL, 0.1 mL, 0.2 mL

**STEP BY STEP METHOD**

I. Calibration

1. Allow all reagents to equilibrate to room temperature (15-30°C).
2. Prepare 1:5, 1:10, 1:20, 1:30 and 1:40 dilutions of Fibrinogen Calibrator using Owren’s Veronal Buffer as follows:

<table>
<thead>
<tr>
<th>Buffer</th>
<th>0.05 mL</th>
<th>0.1 mL</th>
<th>0.2 mL</th>
<th>0.3 mL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:5</td>
<td>0.09 mL</td>
<td>0.18 mL</td>
<td>0.36 mL</td>
<td>0.54 mL</td>
</tr>
<tr>
<td>1:10</td>
<td>0.04 mL</td>
<td>0.08 mL</td>
<td>0.16 mL</td>
<td>0.24 mL</td>
</tr>
<tr>
<td>1:20</td>
<td>0.02 mL</td>
<td>0.04 mL</td>
<td>0.08 mL</td>
<td>0.12 mL</td>
</tr>
<tr>
<td>1:30</td>
<td>0.01 mL</td>
<td>0.02 mL</td>
<td>0.04 mL</td>
<td>0.06 mL</td>
</tr>
<tr>
<td>1:40</td>
<td>0.005 mL</td>
<td>0.01 mL</td>
<td>0.02 mL</td>
<td>0.03 mL</td>
</tr>
</tbody>
</table>

3. Run duplicate determinations on each dilution of the fibrinogen calibrator as follows:
   a. Incubate 0.2 mL of calibrator dilution for 2 minutes at 37°C. Do not exceed 5 minutes at 37°C.
   b. Add 0.1 mL of Thrombin Reagent (room temperature) to immediately initiate the timed reaction.
   c. Determine the clotting time by averaging the readings of the duplicate determinations.

Quality Control
A control should be run with each standard curve or set of assays. Helena Norm-Trol and A.R.P.® have shown that there is no significant change in fibrinogen levels on plasma samples stored up to 3 days at 2-6°C, Nevertheless, it is good laboratory practice to test samples as soon as possible after collection. Plasma may be stored at -20°C, or colder, for at least one month. Thaw quickly at 37°C prior to testing.

**CALCULATION OF UNKNOWN**

1. Plot the average clotting times obtained versus the respective fibrinogen concentration. The Helena Fibrinogen Calibration Graph Paper is printed to accommodate the 1:10 dilution factor. Refer to the instructions for plotting the standard curve given on the Fibrinogen Graph Paper. The concentration value for each lot of calibrator is given on the assay card.

II. Testing

1. Dilute patient plasma and controls 1:10 with Owren’s Veronal Buffer (1 part specimen and 9 parts buffer).
2. Test patient and control dilutions in duplicate in the following manner:
   a. Pipette 0.2 mL of diluted specimens into a specimen cup and incubate it for 2 minutes at 37°C. Do not exceed 5 minutes at 37°C.
   b. Add 0.1 mL of Thrombin Reagent (room temperature) to initiate the timed reaction.
   c. Determine the clotting time by averaging the readings of the duplicate determinations.

**RESULTS**

The fibrinogen assay on the test specimen is generally performed using a 1:10 dilution of plasma. The concentration can then be read in mg/dL directly from the standard curve. For plasma dilutions other than 1:10, the concentration from the curve should be multiplied by the dilution factor (i.e. multiply the concentration value by the dilution factor). For example, if the assay is being assayed a 1:20 dilution (or by 0.5 when assaying a 1:5 dilution), if no detectable clotting occurs using a 1:3 dilution of patient plasma, this is indicative of either a fibrinogen concentration of less than 20 mg/dL, or the presence of some interfering substance (see Limitations of Procedure).

**EXPECTED VALUES**

Plasma of healthy adults contains about 150 to 350 mg/dL of fibrinogen. Helena tested thirty-two (32) presumed healthy donors for fibrinogen levels and obtained the following data.

<table>
<thead>
